8. PH electrode use and maintenance8

First, Application environment

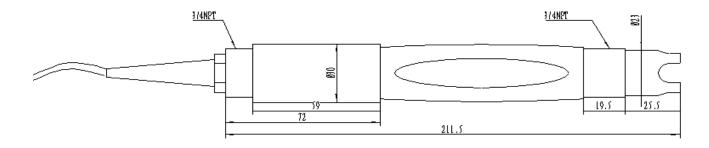

- For acid / base / salt solution, chemical reactions, industrial processes, it is possible to meet the most demanding requirements of industrial applications online PH measurement.
- Signal output: RS485 (Modbus / RTU protocol).
- Easy connection to a PLC, DCS, industrial control computer, universal controller, paperless recording instruments or touch screen and other third-party devices.
- Dual high-impedance differential amplifier, strong anti-jamming, fast response.
- The patented pH probe, the internal reference at least 100KPa (1Bar) pressure than the
 extremely slow oozing fluid from the porous salt bridge, the forward oozing continued for 20
 months. Such a system is very stable reference electrode life more than doubled to extend
 common electrode industry.
- Easy Installation: 3/4 inch NPT (pipe thread) for mounting on pipes and tanks. Probe and a display portion can be separated via a cable connection.
- IP68 protection grade.

Second,

1. Technical parameters

Model	PHG-202
Measuring range	0∼14pH
Resolution	0.01pH
Accuracy	±0.01pH
Working temperature	0~65℃
Working pressure	<0.2MPa
Temp com	N(NTC)
Power supply	12VDC~24VDC ±10%
Output signal	RS485(Modbus /RTU)
Wetted	PPR
Mounting	3/4 "NPT thread, immersion mounting
Cable length	5m, other lengths can be customized
Calibration method	Two-point calibration
Protection class	IP68

2.Size

Modbus communication default data format: 9600, n, 8,1 (baud rate 9600bps, 1 start bit, 8 data bi

3. Communication Protocol

3.1 Data Format

Modbus communication default data format: 9600, n, 8,1 (baud rate 9600bps, 1 start bit, 8 data bits, no parity, 1 stop bit).

Baud rate and other parameters can be customized.

3.2 Frame format information

a) Read data command frame

Address Function Start address Register number CRC code (low byte in front)

b) read data response frame

06 03 xx xx xx xx xx

Address Function Byte Response data CRC code (low byte in front)

c) Write data command frame

Address Function Register Address Write data CRC code (low byte in front)

d) Write data response frame (with write data command frame)

Address Function Register Address Write data CRC code (low byte in front)

3.3 Register Address

Register	Name	Explanation	The	Access
Address			number of	method
			register	
40001	Temperature	4-byte integer, respectively, the	4 (8 byte)	Read
(0x0000)	measuremen	measured value, the measured		
(endedd)	incusurement	value of decimal places,		
		temperature, temperature scale.		
44097	Zero calibration	In the standard solution PH 6.86	1 (2 byte)	Write
(0.4000)		in the calibration data is written	,	
(0x1000)		to zero.		
44099	Slope calibration	In the standard solution PH 4.00	1 (2 byte)	Write
	(4PH)	in the calibration data is written	,	
(0x1002)	,	to zero.		
44101	Slope calibration	In the standard solution PH 9.18	1 (2 byte)	Write
(0x1004)	(9PH)	in the calibration data is written	,	
	,	to zero.		
44103	Zero calibration	Returns zero value calibration.	1 (2 byte)	Read
	value			2. 2. 2.

(0x1006)				
44105	Slop calibration	Back calibration slope values	1 (2 byte)	Read
(0x1008)	value	x1000.		
48195	Sensor address	The default is 6, the write data	1 (2 byte)	Write
(0x2002)		range 1-64.		/Read
48225	Restore Factory	Calibration restore factory	1 (2 byte)	Write
(0x2020)		settings, the write data is 0.		

Note

a) Register address

register address is defined according to the Modbus protocol wearing register type register starting address (in parentheses hexadecimal address representing the actual start of the register)

- b) When changing a sensor address, return instruction in the address for the new sensor address changed.
- c) the definition of the data returned when reading measured values:

XX XX

XX XX XX XX XX XX

2 byte measurement values — measured temperature value Decimal 2 bytes 2 bytes temperature of decimal places

The default data type is: two-byte integer, high byte first; others such as floating-point type is optional.

3.4 Command Example

a) set the sensor ID address

Role: Set the Modbus device address electrodes; The device address 06 to 01, as an example Request frame: 06 06 20 02 00 01 E3 BD; Response frame: 01 06 20 02 00 01 E2 0A;

b) instruction to read the data:

Role: to obtain the measurement probe PH value and temperature; PH units of pH; temperatures

are in degrees Celsius.

Request frame: 06 03 00 00 00 04 45 BE;

Response frame: 06 03 08 00 62 0,002,010,100,012,459

Reading example:

pH value	Temperature value
00 62 00 02	01 01 00 01

Such as: pH value: 0062 represents a hexadecimal value of pH readings, 0002 represents PH value with two decimal places;

Temperature: 01 01 temperature readings indicate a hexadecimal value 0001 represents the

temperature value with a decimal.

a) the calibration instructions:

Zero calibration. Role: PH electrode set zero calibration, zero value 6.86PH standards for the calibration standards, see the following examples;

Request frame: 06 06 10 00 00 00 8C BD Response frame: 06 06 10 00 00 00 8C BD

Slope calibration.

Role: set the pH electrode calibration slope value; slope calibration is divided into high and low calibration, the alkaline solution is measured at a high point calibration; measured in acidic solution at low calibration standard solution here respectively high point 9.18pH, low 4.00pH standard solution for the calibration reference, for example:

High standards 9.18pH calibration:

Request frame: 06 06 10 04 00 00 CD 7C Response frame: 06 06 10 04 00 00 CD 7C

Calibration standards 4.00pH lows: Request frame: 06 06 10 02 00 00 2D 7D Response frame: 06 06 10 02 00 00 2D 7D

3.5 Error response

If the sensor can not properly execute the PC command will return the following message formats:

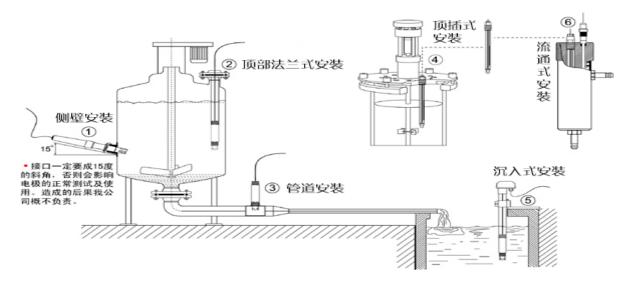

Definition	Address	Function Code	CODE	CRC checksum	
Data	ADDR	COM+80H	XX	CRC 16	
Byte count	1	1	1	2	

a) CODE: 01 - Function code wrong

03 - Data error

b) COM: The function code is received

4.Installation

5. Wiring

5.1 Cable Information

Connection of which is defined as:

- a) red line the power cord (12 ~ 24V)
- b) black wire ground (GND)
- c) blue line -485A
- d) white line -485B
- e) bare wire shielded cable

5.2 Cable Specifications

Taking into account the long-term immersion in water, cable (including seawater) or exposed to air, the cable requires a certain corrosion resistance. Cable outer diameter Φ 6 mm, all interfaces are required to do waterproofing.

5. Quality assurance

The company provides one year starting from the date of sale of the unit Warranty, but does not include damage caused by improper use, if necessary repairs or adjustments, please return, but shipping needs conceited, good packaging when returned to be determined to avoid shipping damaged in transit, the company will free repair damaged equipment.

6. Accessories and Spare Parts

This product includes:

Transmitter with sensor 1 electrolyte 3 package a manual a certificate

7. PH electrode use and maintenance

When measuring pH electrode, should be positive in distilled water (or deionized water) in a clean, dry filter paper with water to prevent impurities into the test solution, the electrode should be 1/3 immersed in the liquid.

Wash the electrodes when not inserted into a protective sleeve plus 3.5mol / L potassium chloride solution, or electrode inserted into the container added 3.5mol / L potassium chloride solution.

Check at the terminals is dry, if the stain, wipe with ethanol, dry after use. Avoid long-term immersion in distilled water or a protein solution, and prevent contact with silicone grease. Use longer electrode which may become translucent glass film or with sediment, washed with dilute hydrochloric acid can be used at this time, and rinsed with water. The electrode using a longer time, measurement error, must be compatible with the instrument calibration, correction.

When the electrodes when maintenance and repair in the above manner can not be calibrated and measured, indicating electrode has expired, replace the electrode.

Standard buffer pH cross-reference table

TEMP℃	4.00	4.01	6.86	7.00	9.18	10.01
0	4.00	4.00	6.98	7.12	9.46	10.32
5	4.00	4.00	6.95	7.09	9.39	10.25
10	4.00	4.00	6.92	7.06	9.33	10.18
15	4.00	4.00	6.90	7.04	9.28	10.12
20	4.00	4.00	6.88	7.02	9.23	10.06
25	4.00	4.01	6.86	7.00	9.18	10.01
30	4.01	4.02	6.85	6.99	9.14	9.97
35	4.02	4.02	6.84	6.98	9.17	9.93
40	4.03	4.04	6.84	6.97	9.07	9.89
45	4.04	4.05	6.83	6.97	9.04	9.86
50	4.06	4.06	6.83	6.97	9.02	9.83

The actual value of the standard instrument sometimes ± 1 count error

8. Service commitment

- Supplier quality inspection departments should establish a standard test procedure, with advanced detection equipment and tools, and in strict accordance with the test procedures for products that do 72 hours aging test, stability test, not a substandard products factory.
- Consignee for failure rate of 2% of the production batch direct return, all costs incurred by the supplier. Consider the standard reference suppliers to provide product descriptions.
- Consignee requires the supplier to ensure that the number of supply and delivery speed.
