SB-19

FIS GAS SENSOR SB-19

for HYDROGEN DETECTION

The SB-19 is a tin dioxide semiconductor gas sensor which has an excellent sensitivity and selectivity to hydrogen. Significant low power consumption design (120mW) is advantageous for portable gas detection devices.

Structure

Gas sensitive semiconductor material is a mini bead type and a heater coil and electrode wire are embedded in the element. The sensing element is installed in the metal housing which uses double stainless steel mesh (100 mesh) in the path of gas flow. The mesh is an anti-explosion feature (Fig 1).

Operating conditions

Fig 2 shows the standard operating circuit for this model. The change of the sensor resistance (R_S) is obtained as the change of the output voltage across the fixed or variable resistor (R_L). In order to obtain the best performance and specified characteristics, the values of the heater voltage (V_H) circuit voltage (V_C) and load resistance (R_L) must be within the range of values given in the standard operating conditions shown in the Specification table on the next page.

Sensitivity characteristics

Fig 3 shows the sensitivity characteristics curves of the SB-19 (typical data). Sensitivity characteristics of the FIS gas sensors are expressed by the relationship between the sensor resistance and gas concentration. The sensor resistance decreases with an increase of gas concentration based on a logarithmic function.

The sensitivity characteristics of the SB-19 is specified by the following parameters.

- Sensor resistance level: at hydrogen 100 ppm
- Sensor resistance change ratio: between hydrogen 100 ppm and 1000 ppm

See the specification table on the next page for further details.
